Property of determinant says that interchange rows changes sign of determinant. Using this property interchange *row1* with *row3*, then interchange *row2* with *row3*, we get

$$= a^2 b^2 c^2 \begin{vmatrix} 1 & -1 & 1 \\ 1 & 1 & -1 \\ -1 & 1 & 1 \end{vmatrix} \quad (2.0.4)$$

By property of determinant that elementary row operations does not change value of the determinant, we get

$$= a^2 b^2 c^2 \begin{vmatrix} 1 & -1 & 1 \\ 1 & 1 & -1 \\ -1 & 1 & 1 \end{vmatrix} \xrightarrow[R_3=R_3-R_1]{R_2=R_2-R_1} a^2 b^2 c^2 \begin{vmatrix} 1 & -1 & 1 \\ 0 & 2 & -2 \\ 0 & 0 & 2 \end{vmatrix} \quad (2.0.5)$$

Determinant of a triangular matrix is equal to product of it's diagonals, so we get

$$= a^2 b^2 c^2 \times (1 \times 2 \times 2) \quad (2.0.6)$$

$$= 4a^2 b^2 c^2 \quad (2.0.7)$$

Hence we showed that

$$\begin{vmatrix} -a^2 & ab & ac \\ ba & -b^2 & bc \\ ca & cb & -c^2 \end{vmatrix} = 4a^2 b^2 c^2 \quad (2.0.8)$$

1 PROBLEM

Show that

$$\begin{vmatrix} -a^2 & ab & ac \\ ba & -b^2 & bc \\ ca & cb & -c^2 \end{vmatrix} = 4a^2 b^2 c^2 \quad (1.0.1)$$

2 SOLUTION

We will show (1.0.1) using only properties of determinants.

By property of determinant we can take multiple of a row out of determinant. Using this property we can take a out of *row1* and b out of *row2* and c out of *row3*, we get

$$\begin{vmatrix} -a^2 & ab & ac \\ ba & -b^2 & bc \\ ca & cb & -c^2 \end{vmatrix} = abc \begin{vmatrix} -a & b & c \\ a & -b & c \\ a & b & -c \end{vmatrix} \quad (2.0.1)$$

By property of determinant that $|A^T| = |A|$, we can rewrite (2.0.1) as

$$= abc \begin{vmatrix} -a & a & a \\ b & -b & b \\ c & c & -c \end{vmatrix} \quad (2.0.2)$$

Again using property we can take a out of *row1* and b out of *row2* and c out of *row3*, we get

$$= a^2 b^2 c^2 \begin{vmatrix} -1 & 1 & 1 \\ 1 & -1 & 1 \\ 1 & 1 & -1 \end{vmatrix} \quad (2.0.3)$$
